| A Brief History of Astronomy | |
|--|--|
| Early Man It was believed that the heavens held power over earthly existence - Different star patterns appeared in the sky when it was time to plant and harvest - Lunar cycles appeared to control fertility - Stonehenge (constructed between 3100-2000 BCE) is designed to align with the summer solstice | |
| Babylonians (~1600 BCE) Earliest written records are of astronomical observations - Position of planets - Times of eclipses | |

Chinese (~1059 BCE)

- Kept careful records of events in the skies, particularly the appearance of "guest stars"
 - Comets, novae, and other transients
- Most important record is of a guest star that was bright enough to be seen during the day in the constellation that we call Taurus in 1054 BCF
 - This is the supernova explosion that resulted in the Crab Nebula

Pythagoras of Samos (~580-500 BCE)

- Plants were attached to crystalline spheres, one for each planet, that produced the "Music of the Spheres"
- The spheres were centered on Earth and the earth was moving
- Recognized that the "morning star" and "evening star" is Venus

Thales ~480 BCE

• Used Babylonian records to predict eclipses

Aristotle 384 - 322BCE

- Earth was situated at the center of the universe
- Adopted Pythagoras' model of concentric spheres for the planets but deduced that the Earth must be immobile

Heraclides ~330 BCE

 Developed a geocentric model of the solar system in which the planets, sun and moon orbited the earth in perfect circles

Aristarchus of Samos ~310-230 BCE

 Concluded that the solar system must be heliocentric according to his geometrical estimates of the relative sizes and distances of the earth, moon, and sun

Eratosthenes of Cyrene 276 – 197 BCE

- Developed a map of the world and estimated the circumference of the Earth
- He calculated a value of 40 320 km
 - The current accepted value is 40 030 km

Hipparchus ~100 BCE

 Produced first star catalog and recorded the names of constellations

Claudius Ptolemy ~85-165 CE

- Developed a mathematical model of he motions of the solar system based on the geocentric model and circular orbits
- Complex model included epicycles to account for retrograde motion

Nikolas Kopernig (Copernicus) 1473-1543

- Developed a heliocentric model of the solar system with circular orbits
- Established the proper order of the planets outward from the sun

Tyge (Tycho) Brahe 1546 - 1601

- Made meticulous observations with instruments that he designed
- Observed a supernova in 1572 and a comet in 1577 and was able to show that they were beyond the moon
- Developed his own model with the earth in the center, but the planets orbiting the sun

Johannes Kepler 1571-1630

- Used Brahe's observations to make highly precise calculations of planetary orbits
- Developed three rules for the orbits of planets
 - Orbits of the planets are ellipses with the Sun at one focus
 - The planets sweep out equal areas during equal times of the orbit

| | |
| | |
| | |
| | |
| | |
| Galileo Galilei | |
| 1564-1642 | |
| Made a number of discoveries in astronomy | |
| using telescopes of his own design | |
| Sunspots on the sunCraters and mountains on the moon | |
| Moons of Jupiter (Io, Europa, Callisto, and | |
| Ganymede) — Rings of Saturn | |
| – Phases of Venus | |
| | |
| | |
| | |
| | 1 |
| Isaac Newton | |
| 1642 - 1727 | |
| Developed the science of mechanics | |
| Mathematically described motionInvented calculus to perform the mathematics | |
| necessary to do the calculations necessary for describing motion | |
| Provided a mathematical basis for Kepler's rules of planetary motion | |
| rates of planetary motion | |
| | |

Some Other Discoveries • 1781, William Herschel discovered Uranus • 1846, Hohan Galle discovered Neptune • 1910, Harlow Shapley estimated the size of milky way the • 1924, Edwin Hubble established that the Andromeda nebula and other "spiral nebulae" are star systems like the Milky Way • 1929, Hubble & Milton Humason discovered that the universe is expanding • 1930, Clyde Tombaugh discovered Pluto • 1931, Karl Jansky observed that the nucleus of the Milky Way and other celestial objects are strong sources of radio waves • 1938, Hans Bethe determined that the Sun's energy comes from thermonuclear fusion reactions • 1948, George Gamov developed the Big Bang Theory of the origin of the universe • 1950s, chemical composition of stars • 1960s, quasars, x-rays, infrared astronomy • 1965, Arno Penzias and Robert Wilson from Bell Laboratories discovered the cosmic microwave background radiation remnant of the Big Bang

• 1968, Jocelyn Bell & Anthony Hewish discovered pulsars
